Telemetry Study Design

Telemetry Study Design

Telemetry System Performance

Environment

Attenuation

- Turbidity
- Entrained air
- Thermocline
- Bathymetry
- Vegetation

Noise

- Waves
- Current
- Precipitation
- Human activity
- Animals

Biology

- Swim speed
- Elevation
- Space use
- Survival
- Aggregation
- Tag effects

Receivers

- Location
(x,y,z)
- Orientation
- Rigging

Transmitters

- Power (SPL)
- Delay
- Coding scheme
- Tag life
- Size and shape

Telemetry System Performance

2 concerns (of many)

1. Collisions

Objective:

Determine min. tag delay & max. number of tagged fish to minimize destructive tag code collisions.

2. Receiver spacing (detection range)

Objective:

Determine max. receiver spacing to detect all fish passing a receiver line.

Managing Collisions

Multiple Pulse Coded Tags (e.g., Vemco Global coding)

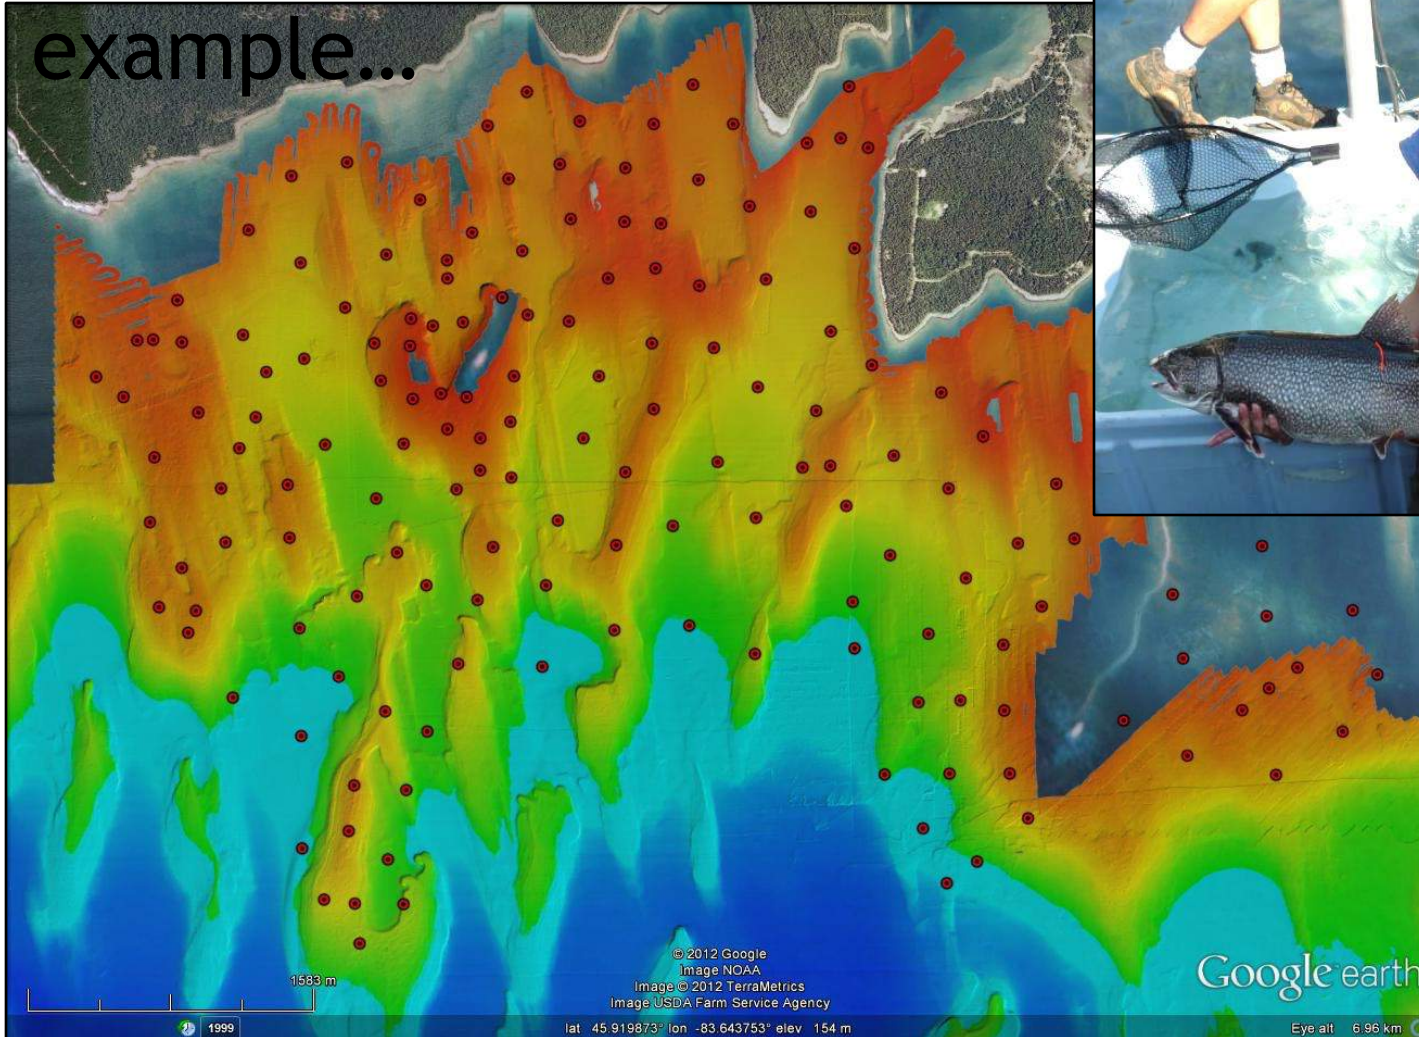

Destructive collision

Managing Collisions

A motivating example...

- VPS array
- 27 km²
- 149
VR2W

Managing Collisions

Managing Collisions

Managing Collisions

Objective 1:

Determine min. tag delay & max. number of tagged fish to minimize destructive tag code collisions.

Managing Collisions

Choosing tag delay:

Simulate collisions (R function)

Prob. of collision

“Effective” delay

Burst duration
Tag delay (uniform dist.)
of fish present

Transmissions

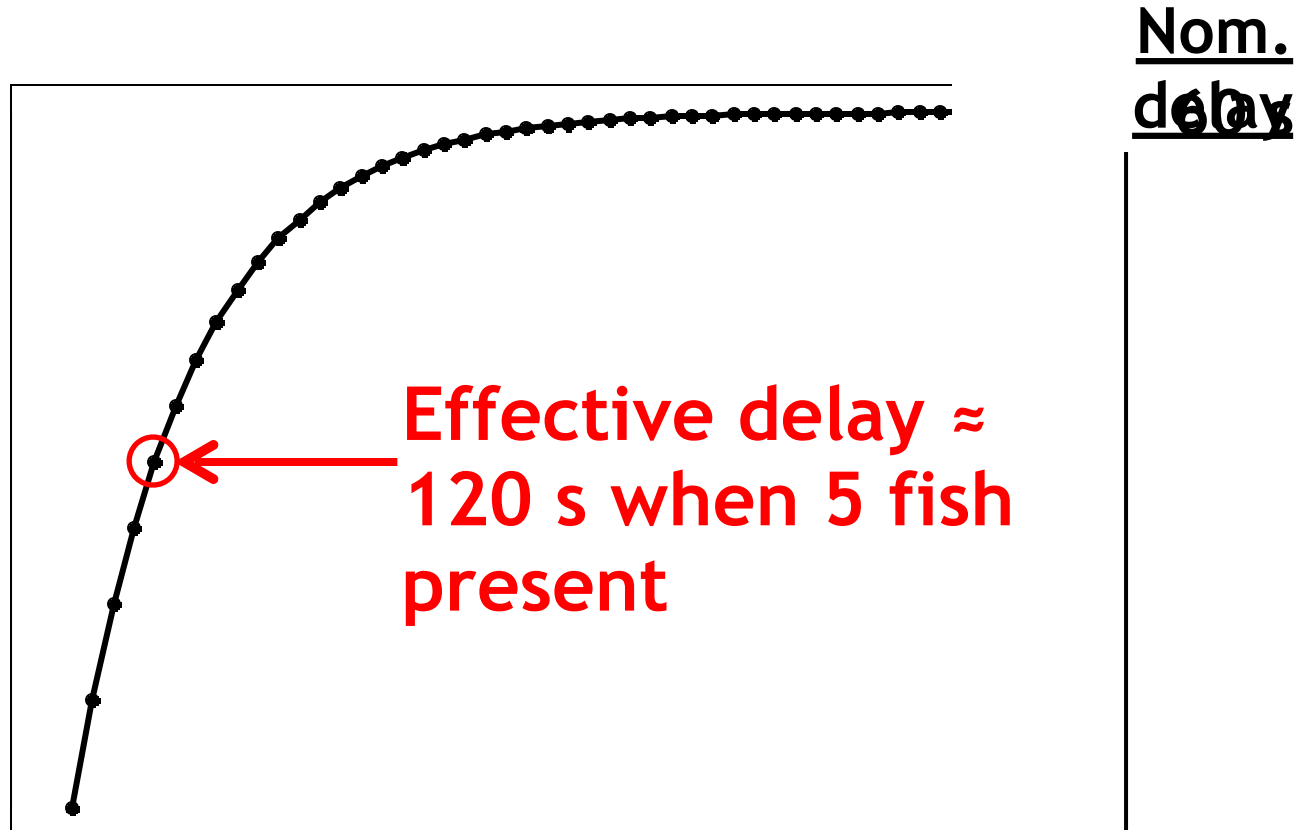

Detections

Managing Collisions

Choosing tag delay:

Managing Collisions

Choosing tag delay:

Nom. delay
90 s

Managing Collisions

Choosing tag delay:

Nom.
delay

90 s

120 s

Managing Collisions

Telemetry System Performance

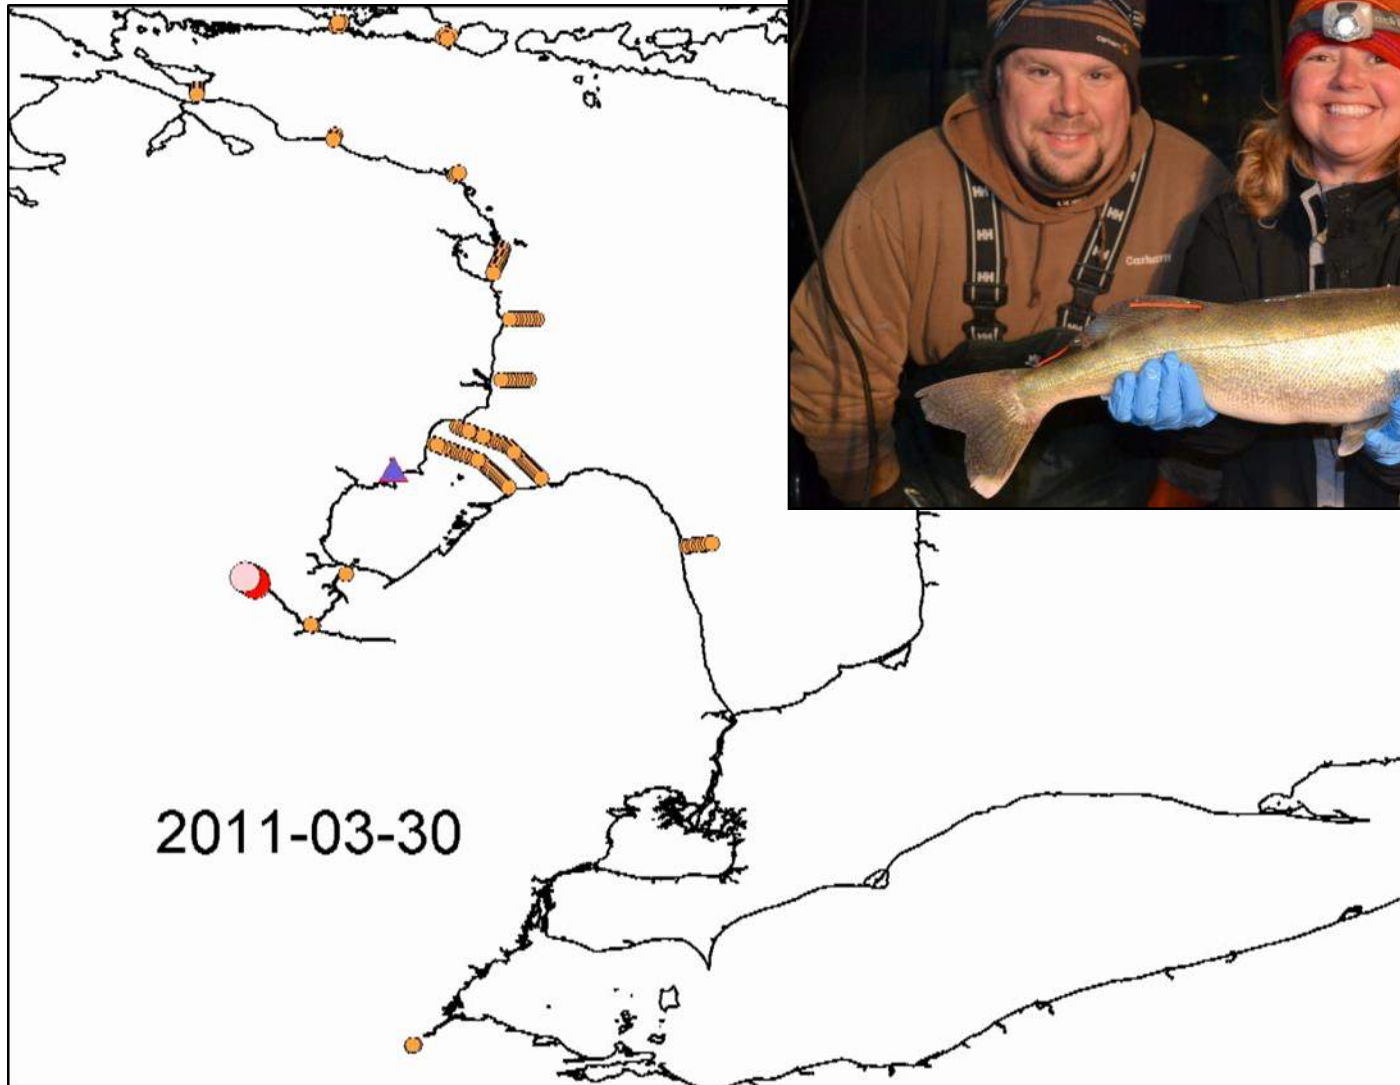

2. Receiver spacing (detection range)

Objective:

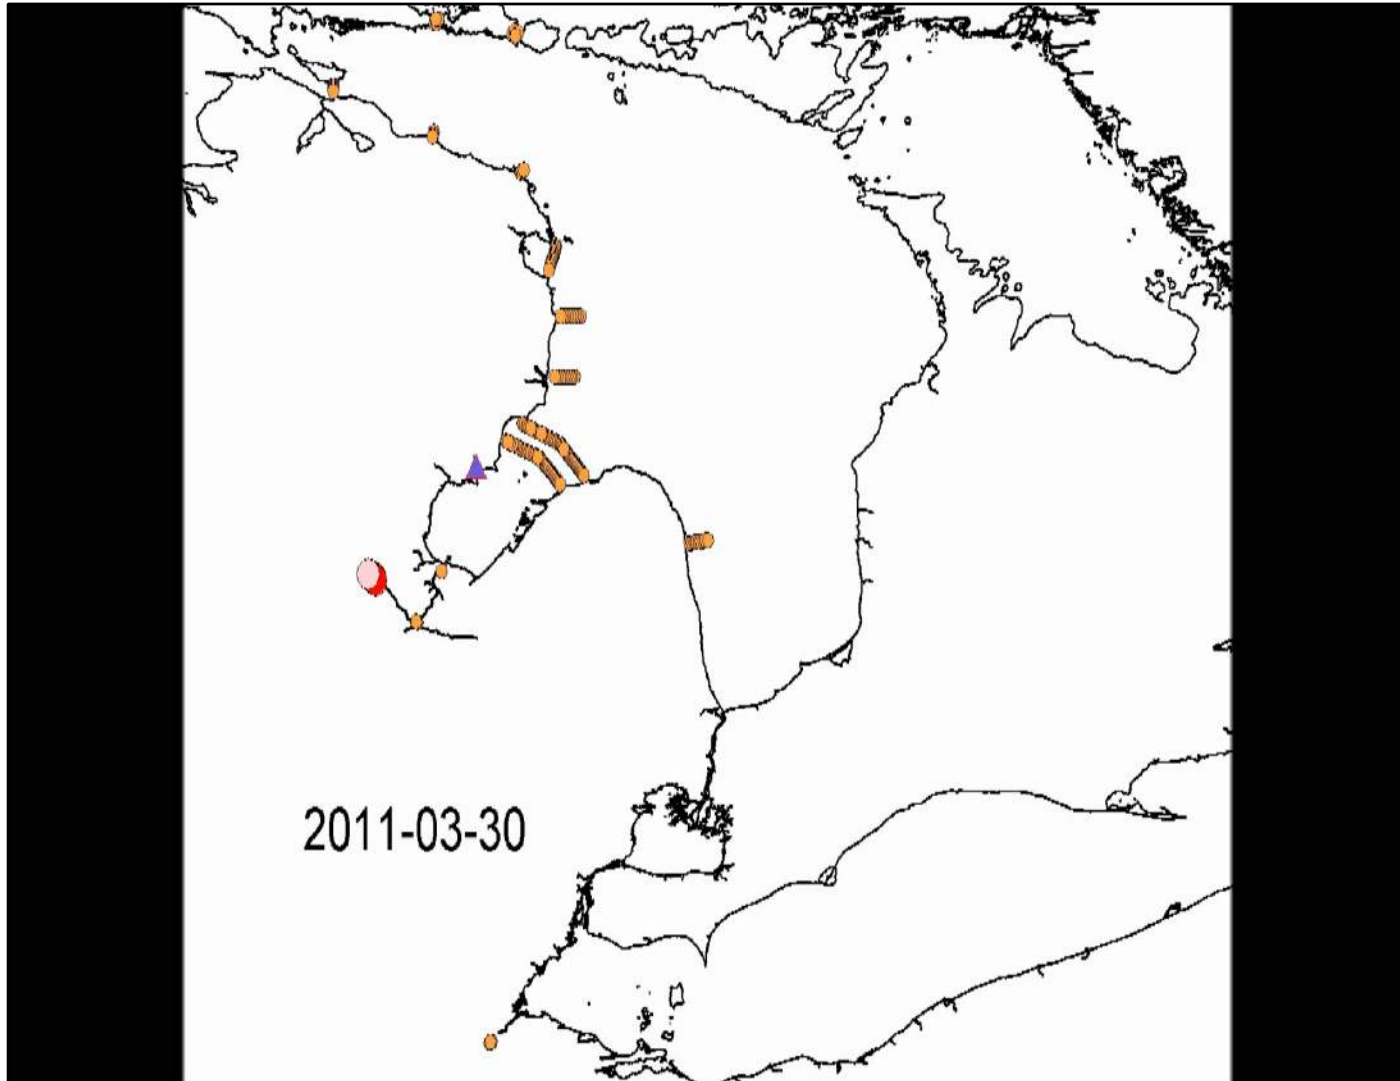

Determine max. receiver spacing to detect all fish passing a receiver line.

Detection Range

Detection Range

Detection Range

Approach:

1. Describe detection range curve - in situ test
2. Simulate fish passing receiver line
 - estimate line detection probability

Detection Range

10-day static range test

Detection Range

10-day static range test

- 7 receivers (VR2W)
- 2 sentinel tags
 - V16-4H (25 s)

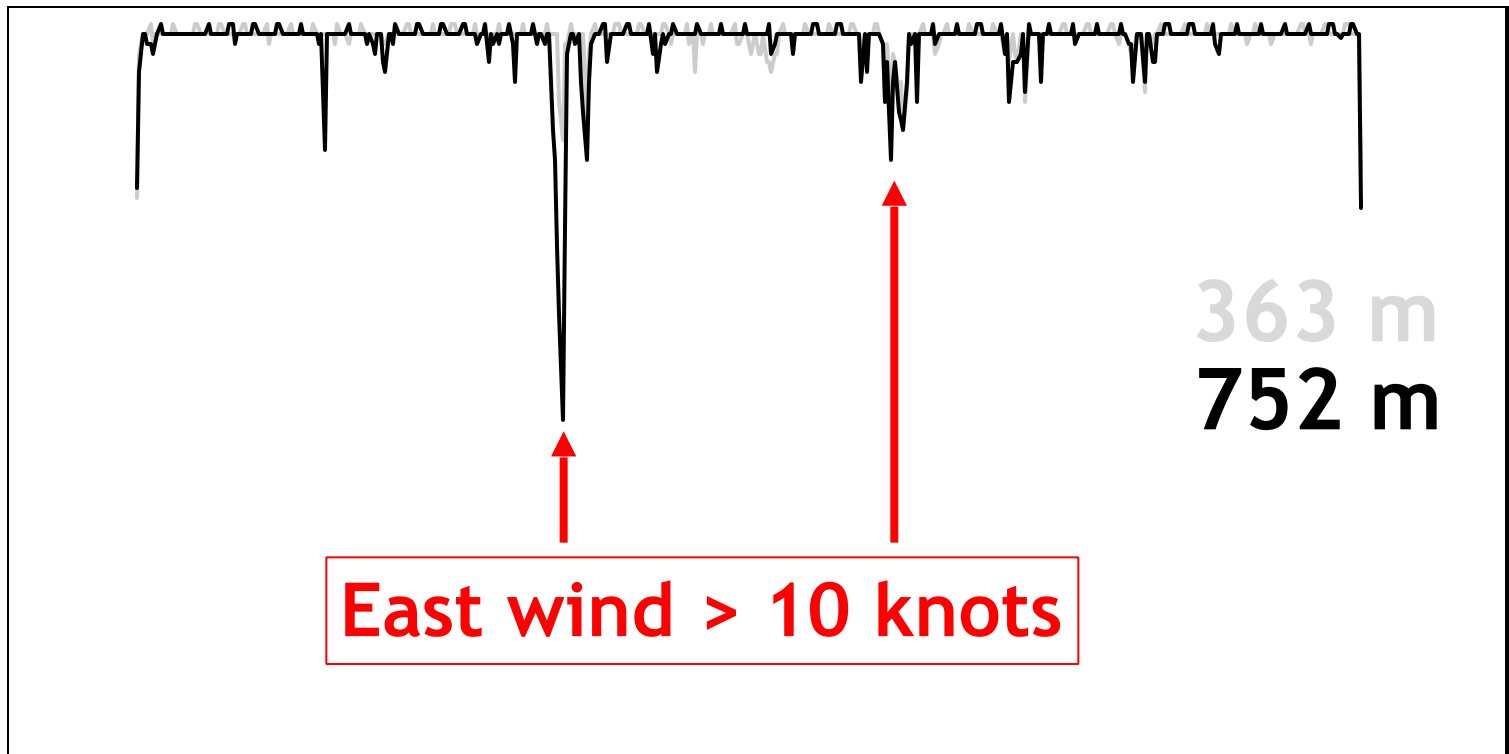

Detection Range

10-day static range test

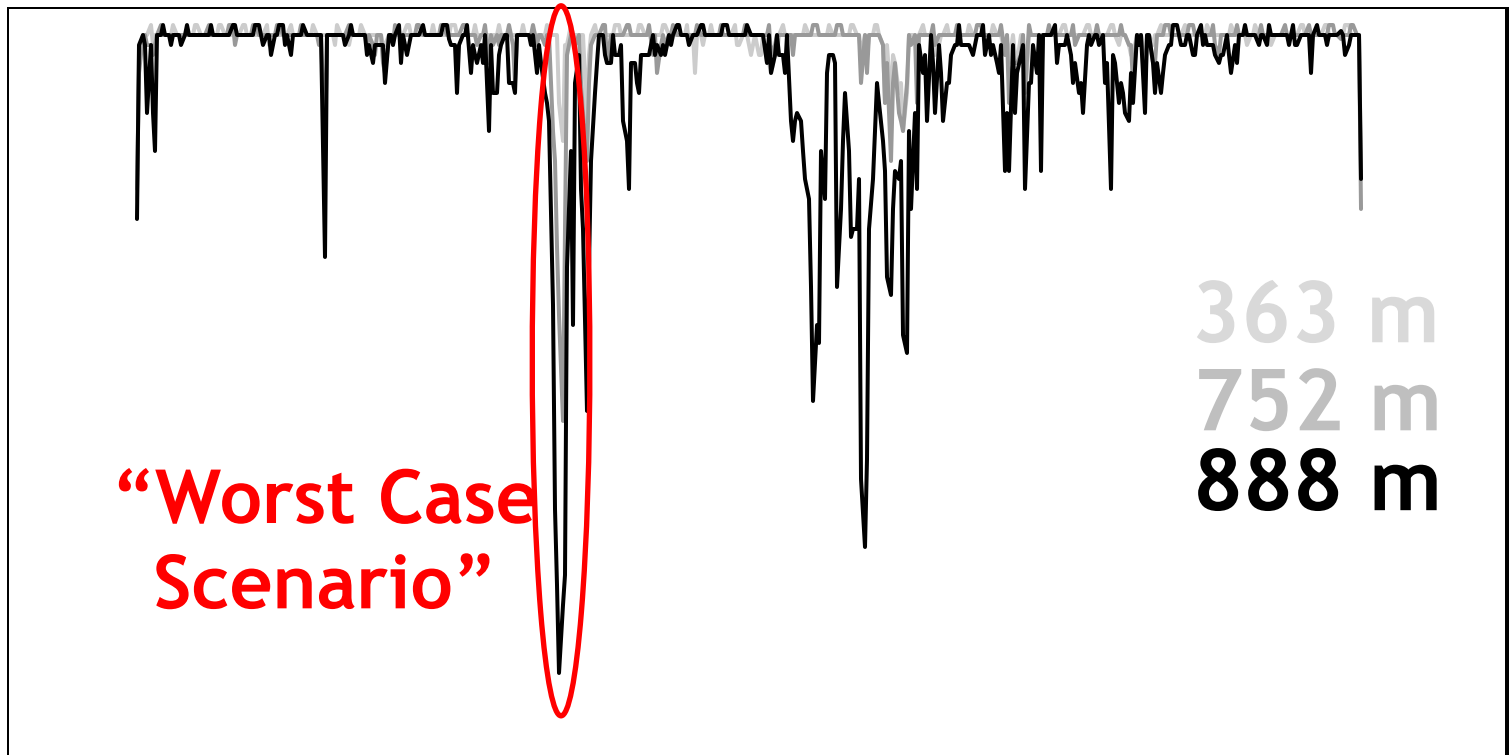

Detection Range

10-day static range test

Detection Range

10-day static range test

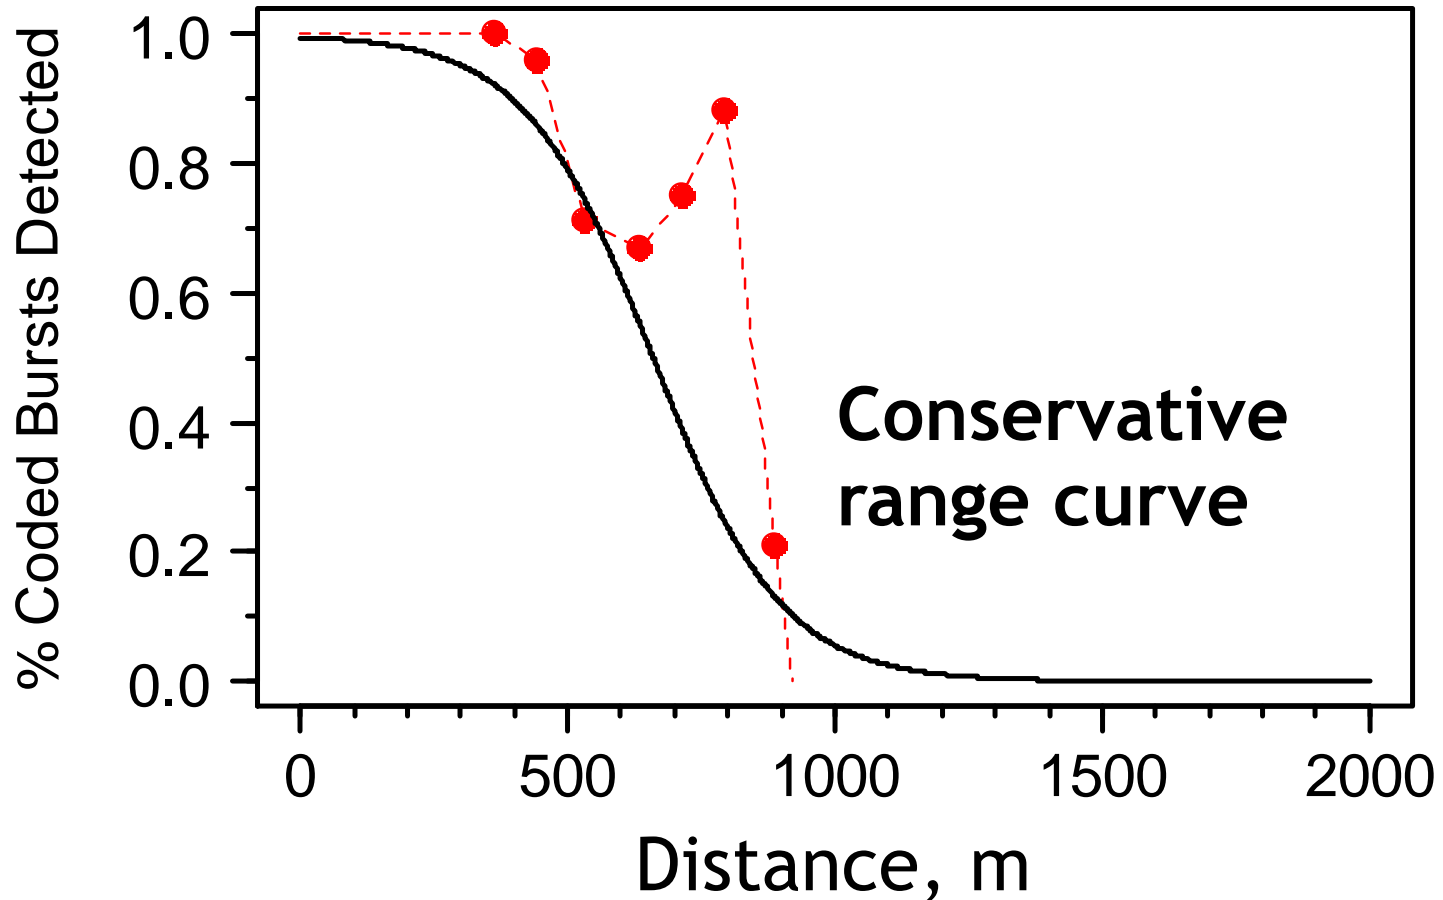

Detection Range

10-day static range test

Detection Range

10-day static range test

Receiver Spacing

Simulate fish passing receiver line (R function)

Inspired by Pincock (2009) http://www.vemco.com/pdf/line_performance.pdf

Input parameters

– Detection prob. curve

Receiver Spacing

Simulate fish passing receiver line (R function)

Inspired by Pincock (2009) http://www.vemco.com/pdf/line_performance.pdf

Input parameters

- Detection prob. curve
- Receiver spacing (m)

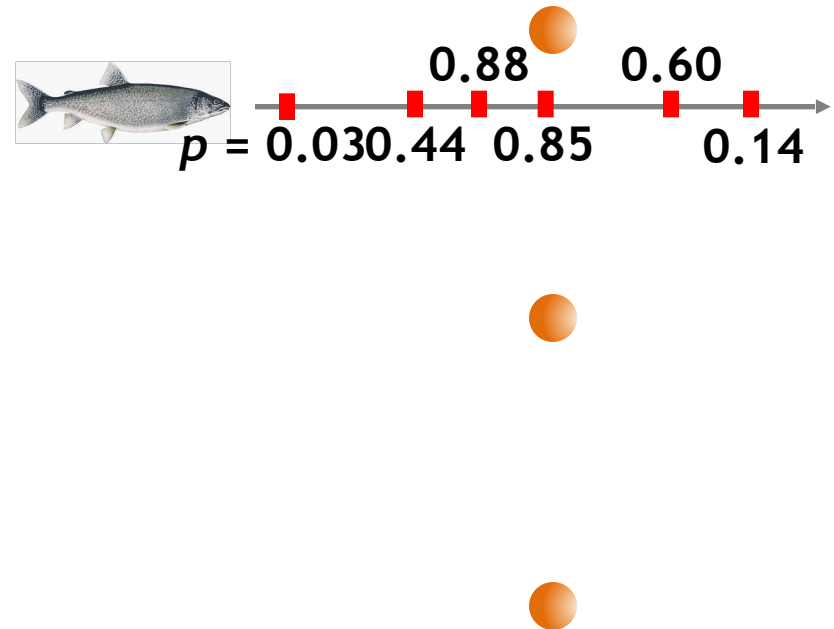

Receiver Spacing

Simulate fish passing receiver line (R function)

Inspired by Pincock (2009) http://www.vemco.com/pdf/line_performance.pdf

Input parameters

- Detection prob. curve
- Receiver spacing (m)
- Fish velocity (m/s)
- Tag delay range (s)
- Burst duration (s)

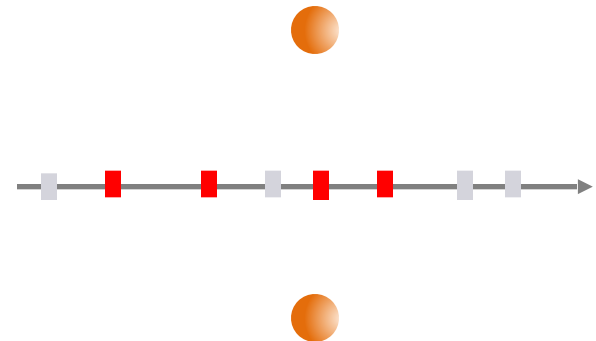

Receiver Spacing

Simulate fish passing receiver line (R function)

Inspired by Pincock (2009) http://www.vemco.com/pdf/line_performance.pdf

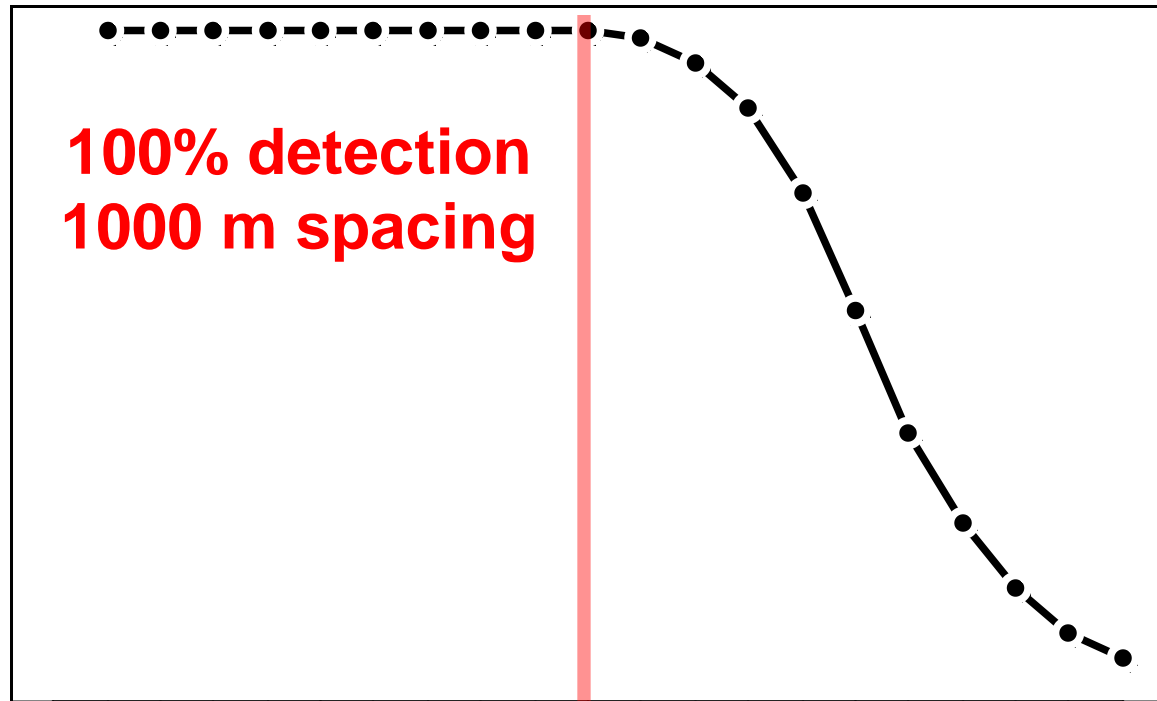

Input parameters

- Detection prob. curve
- Receiver spacing (m)
- Fish velocity (m/s)
- Tag delay range (s)
- Burst duration (s)

Receiver Spacing

Simulate fish passing receiver line

Receiver Spacing

Simulate fish passing receiver line

Receiver Spacing

Simulate fish passing receiver line

Receiver Spacing

Simulate fish passing receiver line

Receiver Spacing

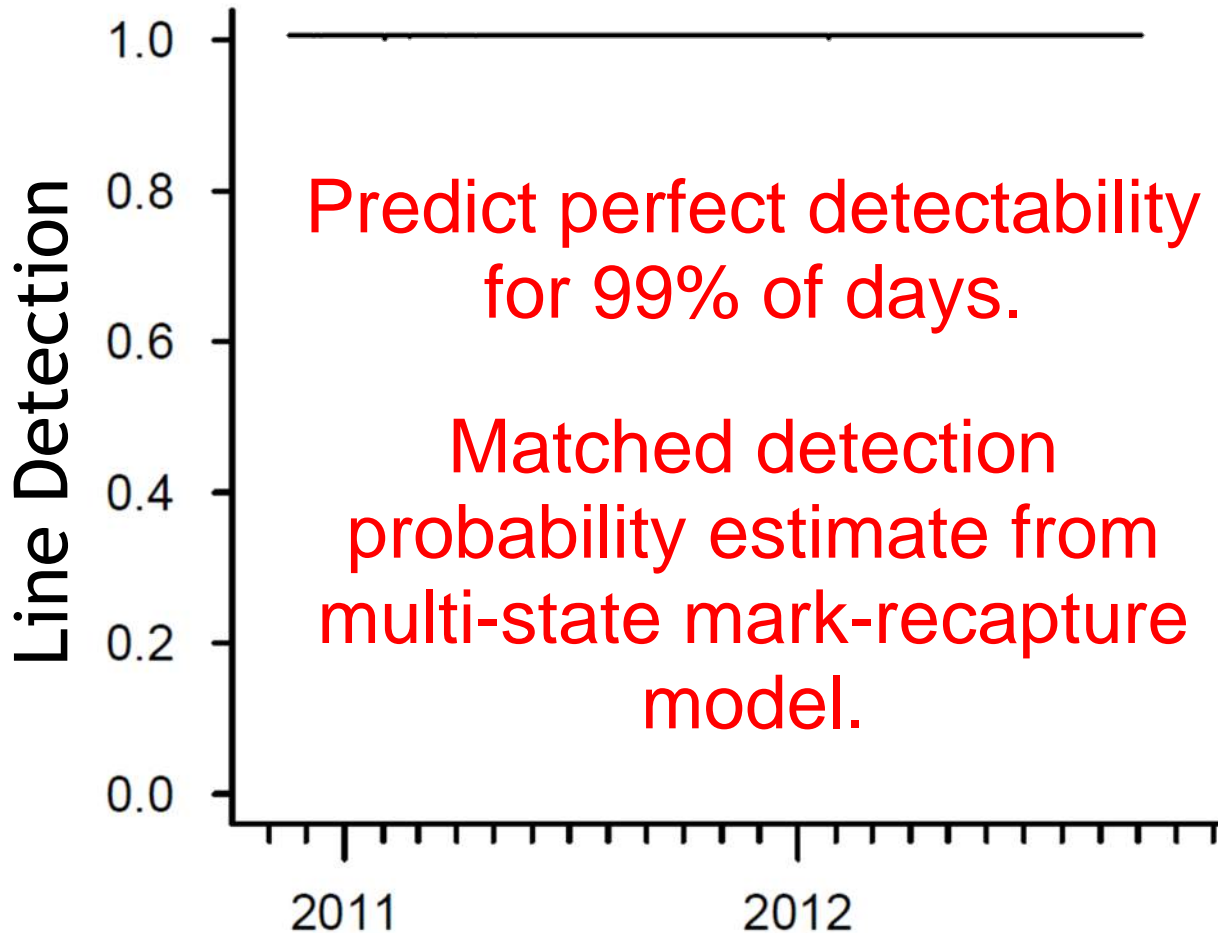

At four locations over two years:

- Estimated daily detection range curves
 - 2 sentinel tags at each site
- Estimated line detection probability
 - simulation

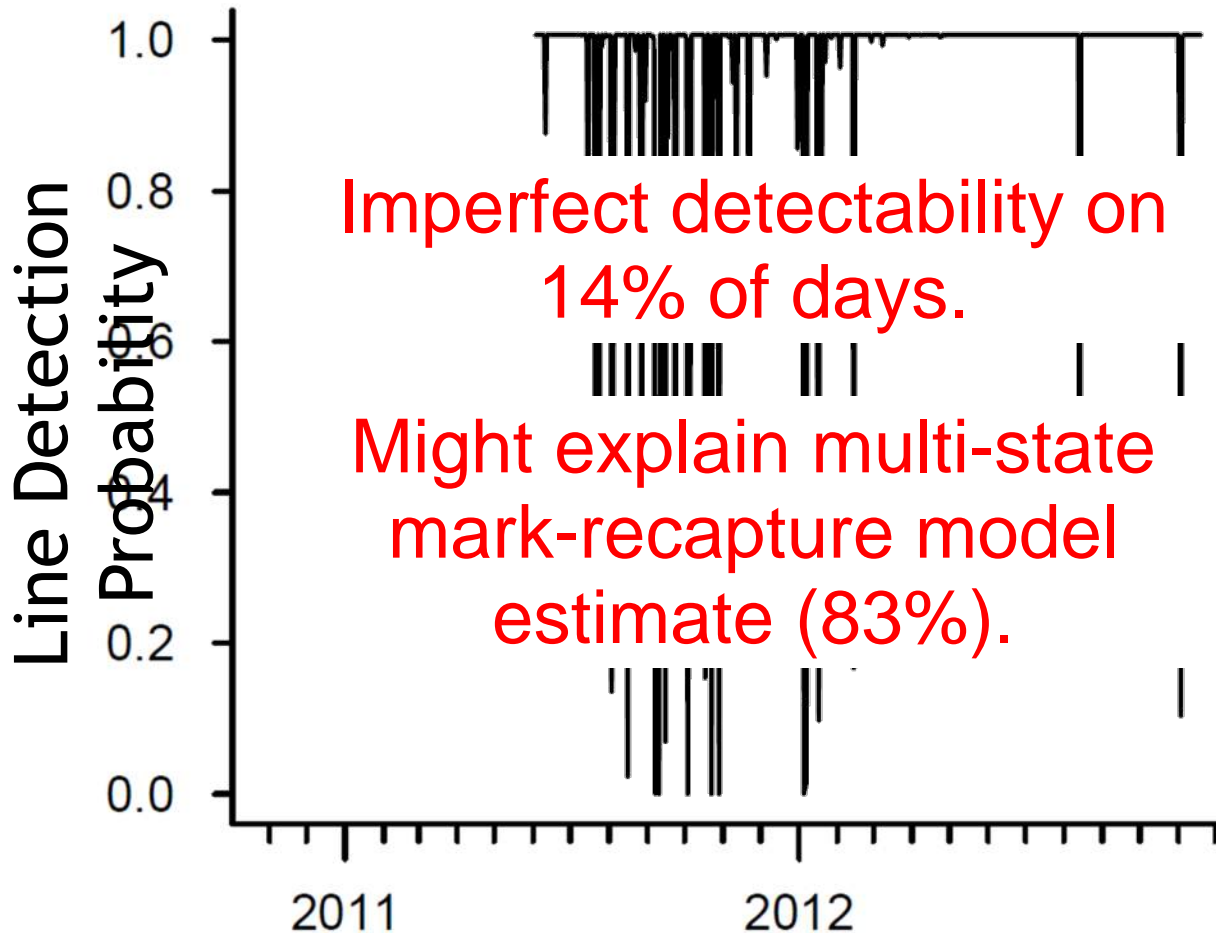

Receiver Spacing

Site 1 - 1000 m spacing

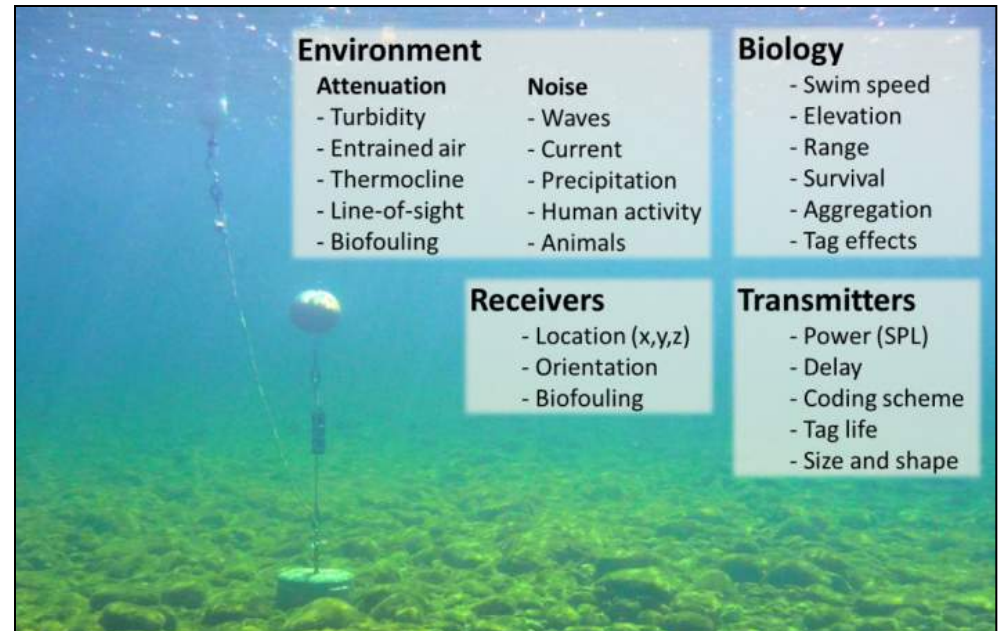

Receiver Spacing

Site 3 - 1000 m spacing

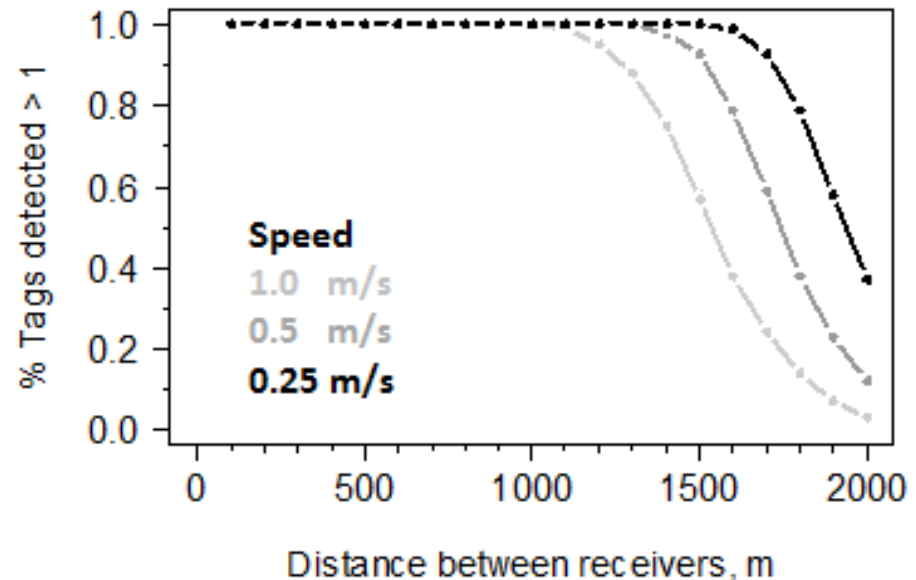

Summary

-Pilot data invaluable (“Plan for the worst...”) but need to capture real variation in performance across space and time.

Summary

- Pilot data invaluable (“Plan for the worst...”) but need to capture real variation in performance across space and time.
- Can predict performance during, and after a simulation.
- Accessibility will be key to broader use of simulation tools.
